

Results from Lilly's Landmark Phase 3 Trial of Donanemab Presented at Alzheimer's Association Conference and Published in JAMA

July 17, 2023

Donanemab significantly slowed cognitive and functional decline for amyloid-positive early symptomatic Alzheimer's disease patients, lowering their risk of disease progression; nearly half of participants at earlier stage of disease on donanemab had no clinical progression at 1 year

Additional subpopulation analyses presented live showed that those study participants at earliest stage of disease had even greater benefit, with 60% slowing of decline compared to placebo

Furthermore, treatment effect continued to increase relative to placebo over the course of the trial, even though many participants completed their course of therapy at 6 or 12 months, supporting limited duration dosing

FDA submission completed in Q2; regulatory action expected by end of year

INDIANAPOLIS, July 17, 2023 /PRNewswire/ -- Eli Lilly and Company (NYSE: LLY) presented full results from the Phase 3 TRAILBLAZER-ALZ 2 study showing that donanemab significantly slowed cognitive and functional decline in people with early symptomatic Alzheimer's disease (AD). The data were shared at the 2023 Alzheimer's Association International Conference (AAIC) as a featured symposium and simultaneously published in the [Journal of the American Medical Association \(JAMA\)](#).

"The positive TRAILBLAZER-ALZ 2 data bring hope to people with Alzheimer's disease who urgently need new treatment options. This is the first Phase 3 study of a disease-modifying therapy to replicate the positive clinical results observed in a previous study," said Anne White, executive vice president of Eli Lilly and Company and president of Lilly Neuroscience. "If approved, we believe donanemab can provide clinically meaningful benefits for people with this disease and the possibility of completing their course of treatment as early as 6 months once their amyloid plaque is cleared. We must continue to remove any barriers in access to amyloid-targeting therapies and diagnostics in an already complex healthcare ecosystem for Alzheimer's disease."

Lilly [previously announced](#) that donanemab met the primary and all cognitive and functional secondary endpoints in the Phase 3 study. Submission to the U.S. FDA for traditional approval was completed last quarter with regulatory action expected by the end of the year. Submissions to other global regulators are currently underway, and the majority will be completed by year end.

The TRAILBLAZER-ALZ 2 results support Lilly's application for regulatory approval to treat people with amyloid-positive early symptomatic Alzheimer's disease (either mild cognitive impairment or mild dementia), regardless of their baseline level of tau. TRAILBLAZER-ALZ 2 enrolled participants with a broader range of cognitive scores and amyloid levels than other recent trials of amyloid plaque-targeting therapies. Participants in TRAILBLAZER-ALZ 2 were stratified by their level of tau, a predictive biomarker for disease progression, into either a low-medium tau group (sometimes referred to as intermediate tau) or a high tau group, which represented a later pathological stage of disease progression. All participants were then assessed over 18 months using scales that measure both cognition and function, including the integrated Alzheimer's Disease Rating Scale (iADRS) and the Clinical Dementia Rating-Sum of Boxes (CDR-SB).

As previously reported, among participants with low-medium levels of tau (n=1182), donanemab treatment significantly slowed decline by 35% on iADRS and 36% on CDR-SB. Among all amyloid-positive early symptomatic AD study participants (n=1736), treatment with donanemab significantly slowed decline by 22% on iADRS and 29% on CDR-SB. Additional data presented at AAIC reinforced that regardless of baseline clinical or pathological stage of disease, treatment with donanemab resulted in cognitive and functional benefits relative to placebo:

- A pre-specified subpopulation analysis of low-medium tau participants based on clinical stage showed greater benefit of donanemab in those at earlier stage of disease:
 - In participants with mild cognitive impairment (n=214), donanemab slowed decline by 60% on iADRS and 46% on CDR-SB (for those with mild dementia due to AD, n=534, donanemab slowed decline by 30% on iADRS and 38% on CDR-SB, respectively).
- Similarly, a post-hoc subgroup analysis of low-medium tau participants based on age showed greater benefit of donanemab in patients under the age of 75:
 - In participants under the age of 75 (n=542), donanemab slowed decline by 48% on iADRS and 45% on CDR-SB.
 - In participants aged 75 or greater (n=551), donanemab slowed decline by 25% on iADRS and 29% on CDR-SB.
- Results were similar across other subgroups, including participants who carried or did not carry an ApoE4 allele.
- The overall treatment effect of donanemab continued to grow throughout the trial, with the largest differences versus placebo seen at 18 months.

"These results demonstrate that diagnosing and treating people earlier in the course of Alzheimer's disease may lead to greater clinical benefit," said Liana Apostolova, M.D., distinguished professor in Alzheimer's Disease research and professor in neurology, radiology, medical and molecular genetics at Indiana University School of Medicine, where she is associate dean for Alzheimer's disease research and directs the clinical core of the Alzheimer's Disease Center. "The delay of disease progression over the course of the trial is significant and will give people more time to do such things that are meaningful to them."

Donanemab specifically targets deposited amyloid plaque and has been shown to lead to plaque clearance in treated patients. Treatment with donanemab significantly reduced amyloid plaque levels regardless of baseline pathological stage of disease. Among all participants, treatment with donanemab reduced amyloid plaque on average by 84% at 18 months, compared with a 1% decrease for participants on placebo. Participants were able to stop taking donanemab once they achieved pre-defined criteria of amyloid plaque clearance.* Approximately half of participants met this threshold at 12 months and approximately seven of every ten participants reached it at 18 months.

In the earlier pathological stage of disease in participants with low-medium tau, treatment with donanemab resulted in 47% of participants with no progression at one year on the CDR-SB assessment, versus 29% on placebo. Those participants treated with donanemab also had a 39% lower risk of progressing to the next clinical stage of disease over the 18-month trial. This delay in progression meant that, on average, participants treated with donanemab had an additional 7.5 months before they reached the same level of cognitive and functional decline on CDR-SB compared to those on placebo.

"People living with early, symptomatic Alzheimer's disease are still working, enjoying trips, sharing quality time with family – they want to feel like themselves, for longer," said Mark Mintun, M.D., group vice president Neuroscience Research & Development at Lilly, and president of Avid Radiopharmaceuticals. "The results of this study reinforce the importance of diagnosing and treating disease sooner than we do today."

The incidence of amyloid-related imaging abnormalities (ARIA) and infusion-related reactions was consistent with the previous TRAILBLAZER-ALZ study. ARIA occurs across the class of amyloid plaque clearing antibody therapies. It is most commonly observed as temporary swelling in an area or areas of the brain (ARIA-E) or as microhemorrhages or superficial siderosis (ARIA-H), in either case detected by MRI, and these may be serious and even fatal in some cases. This risk should be managed with careful observation, monitoring with MRIs, and appropriate actions if ARIA is detected. Serious infusion-related reactions and anaphylaxis were also observed.

Adverse Events	Donanemab Group (n=853)	Placebo Group (n=874)
Any serious adverse event	17.4 %	15.8 %
Overall death	1.9 %	1.1 %
Death related to treatment	0.4 %	0.1 %
Infusion-related reaction (IRR)	8.7 %	0.5 %
Any ARIA (-E or -H)	36.8 %	14.9 %
ARIA-E (asymptomatic)	17.9 %	1.9 %
ARIA-E (symptomatic)	6.1 %	0.1 %
ARIA-H	31.4 %	13.6 %

A live webcast of the scientific session at AAIC featuring the donanemab presentations can be viewed on the [investor section of Lilly's web site](#).

Lilly will host an investor call on Monday, July 17, at 1:30 p.m. EDT (10:30 a.m. PDT) to discuss the company's presentations at the Alzheimer's Association International Conference.

About TRAILBLAZER-ALZ 2 Study and the TRAILBLAZER-ALZ program

TRAILBLAZER-ALZ 2 (NCT04437511) is a Phase 3, double-blind, placebo-controlled study to evaluate the safety and efficacy of donanemab in participants ages 60-85 years with early symptomatic Alzheimer's disease (MCI or mild dementia due to Alzheimer's disease) with the presence of confirmed Alzheimer's disease neuropathology. The trial enrolled 1736 participants, across 8 countries, selected based on cognitive assessments in conjunction with amyloid plaque imaging and tau staging by PET imaging.

Lilly previously [announced](#) and [published](#) in the *New England Journal of Medicine* (NEJM) results from the Phase 2 TRAILBLAZER-ALZ study in 2021. In addition, Lilly [shared](#) data from TRAILBLAZER-ALZ 4, the first active comparator study in early symptomatic Alzheimer's disease, at the 15th Clinical Trials on Alzheimer's Disease (CTAD) conference in 2022.

Lilly continues to study donanemab in multiple clinical trials, including TRAILBLAZER-ALZ 3, which is focused on preventing symptomatic Alzheimer's disease in participants with preclinical AD; TRAILBLAZER-ALZ 5, a registration trial for early symptomatic Alzheimer's disease currently enrolling in China; and TRAILBLAZER-ALZ 6, which is focused on expanding our understanding of ARIA through novel MRI sequences, blood-based biomarkers, and different dosing regimens of donanemab.

About Lilly

Lilly unites caring with discovery to create medicines that make life better for people around the world. We've been pioneering life-changing discoveries for nearly 150 years, and today our medicines help more than 51 million people across the globe. Harnessing the power of biotechnology, chemistry and genetic medicine, our scientists are urgently advancing new discoveries to solve some of the world's most significant health challenges, redefining diabetes care, treating obesity and curbing its most devastating long-term effects, advancing the fight against Alzheimer's disease, providing solutions to some of the most debilitating immune system disorders, and transforming the most difficult-to-treat cancers into manageable diseases. With each step toward a healthier world, we're motivated by one thing: making life better for millions more people. That includes delivering innovative clinical trials that reflect the diversity of our world and working to ensure our medicines are accessible and affordable. To learn more, visit [Lilly.com](#) and [Lilly.com/newsroom](#) or follow us on [Facebook](#), [Instagram](#), [Twitter](#) and [LinkedIn](#). P-LLY

* Participants completed their course of treatment with donanemab once they reached a pre-defined level of plaque clearance. Average baseline amyloid levels were ~100 Centiloids for participants with early symptomatic Alzheimer's disease.

Cautionary Statement Regarding Forward-Looking Statements

This press release contains forward-looking statements (as that term is defined in the Private Securities Litigation Reform Act of 1995) about donanemab as a potential treatment for people with early symptomatic Alzheimer's disease and the timeline for future readouts, presentations, and other milestones relating to donanemab and its clinical trials and reflects Lilly's current beliefs and expectations. However, as with any pharmaceutical product, there are substantial risks and uncertainties in the process of drug research, development, and commercialization. Among other things, there is no guarantee that planned or ongoing studies will be completed as planned, that future study results will be consistent with study findings to date, that donanemab will prove to be a safe and effective treatment, or that donanemab will receive regulatory approval. For further discussion of these and other risks and uncertainties, see Lilly's Form 10-K and Form 10-Q filings with the United States Securities and Exchange Commission. Except as required by law, Lilly undertakes no duty to update forward-looking statements to reflect events after the date of this release.
